The following reference notes apply only to Table 7 - Daily River Stages:

Readings are made at approximately 7 a.m. (local time). They are provisional and subject to correction. Final and corrected stages will be published in the annual publication "Daily River Stages - Principal Rivers of the United States".

a Obstructed by rough ice.
b Frozen but open at gage.
c Upper surface of smooth ice.
d Ice gorge above gage.
e Ice gorge below gage.
f Shore ice.
g Floating ice.
h Pool stage.
i Dry at gage.
j Interpolated.

REFERENCE NOTES

The four digit identification numbers in the index number column of the Station Index are assigned on a state basis. There will be no duplication of numbers within a state.

Stations appearing in the Index, but for which data are not listed in the tables, are either missing or received too late for inclusion in this issue.

Delayed data and corrections will be carried only in the June and December issues of this bulletin.

Data in Tables 3, 5 and 6 are for the 24-hours ending at time of observation. See the Station Index for observation time.

-	No record.
+	And also on later dates.
*	Amount included in following measurement, time distribution unknown.
//	Gage is equipped with windshield.
6	No recording gage, precipitation is measured at 6-hourly intervals.
a, b, c, through i	Number of days missing. a indicates one day missing, b indicates two days missing, etc.
n	This entry in time of observation column in Station Index means noon.
ar	This entry in time of observation column in Station Index means after rain.
ss	This entry in time of observation column in Station Index means sunset.
r	Station equipped with recording gage only. All amounts in Table 3 are from the non-recording gages, except for stations with this reference.
x	Daily precipitation totals in Table 3 are for the 24-hours ending at 1:30 A.M. E.S.T. of the following day.
z	Hourly amounts from recording gage at the same site may be found in Table 4.
T	Trace, an amount too small to measure.

Data in Table 4 were formerly published in the Hydrologic Bulletin for North Atlantic District. Amounts in this table are from recording gages. Traces are not shown.

Subscription Price: 15¢ per copy; $1.50 a year. (Yearly subscription includes Annual Summary. Correspondence regarding subscriptions should be addressed to the Weather Records Processing Center, Federal Building, Albany 1, N.Y.)

CLIMATOLOGICAL DATA

NEW ENGLAND

AUGUST 1948

Volume LX No. 8

WASHINGTON: 1949

ACKNOWLEDGMENTS

In addition to the climatological data from some 6,000 Weather Bureau and cooperative weather stations, this bulletin series contains records from Hydroclimatic Network Stations which were formerly reproduced in the Hydrologic Bulletin Series. The Hydroclimatic Network is a nationwide net of rain gages -- mostly of the recording type which produce continuous records of precipitation. It was established in 1939 at the request of the Corps of Engineers, Department of the Army, to supplement existing precipitation stations in order to provide records of rainfall intensity which were essential to the planning of flood control and related works by the Corps of Engineers. This Network, now numbering about 2,000 recording, and 1,000 non-recording rain gages, has been maintained by the Weather Bureau through working funds transferred annually to the Weather Bureau by the Corps of Engineers. These transfers averaged about $250,000 per year between 1940 and 1944, and nearly $375,000 since that date. For the years 1940-42, the Department of Agriculture transferred about $100,000 per year to provide data required in its work, and since 1947 the Bureau of Reclamation has transferred about $25,000 per year to meet the increasing needs of their program in the Western States.

Previous to the introduction of this bulletin series, data from Hydroclimatic Network stations were presented in bulletins (Hydrologic Bulletins) which were issued monthly for each of 8 drainage areas embracing the entire United States, but since the Network was established to meet the internal requirements of the Federal agencies referred to above, no provision was made for public dissemination of the data, distribution being limited to cooperating agencies and to certain public repositories. A list of locations where reference copies of the Hydrologic Bulletin Series are available for inspection may be obtained upon application to Chief, U.S. Weather Bureau, Washington 25, D.C.

Many other records published in this bulletin have been made available through the cooperation of various public offices, private agencies, and individuals as listed in the Station Index.

NEW ENGLAND - 1948

W. H. Tracy, Section Director - Boston, Mass.

GENERAL SUMMARY

ne rainfall in August, 1948 varied widely, with monthly totals ranging from ess than a quarter inch in the Penobscot Bay region to over six inches in est-central Vermont and Grafton County, N.H. Withal, the Section average was onsiderably below normal, and in the last decade drouth conditions developed ver central and eastern portions. The only extensive electrical disturbance as on the 12-13th, during which local damage was confined to the southern arts of the Section. This was the last general precipitation until the end of ne month, when scattered light showers served to ameliorate slightly the etarding effect on vegetation that lack of moisture had produced. The most evere and protracted heat-wave of authentic record so late in the season verspread the entire Section from the 24th to the 29th, accentuating the dry-ng of gardens, grass and pasture lands and the forest floor, bringing serious ire hazard to wooded areas. Fruit and berries had been maturing rapidly, but nen the heat wave struck foliage wilted, corn leaves "rolled", fruits were un-scalded and grass burned. Poultry flocks were decimated: ten tons were uried by one Cooperative, the heat-killed poultry being unfit for marketing. tream-flow decreased sharply, brooks disappeared. These effects were most evere in central and southern Maine, southern New Hampshire and eastern parts southern New England, less serious in Vermont and the Berkshire area, where any stations reported adequate rainfall. But for the residuum of soil-mois-ure from last winter's heavy snows and the abundant rains of spring and early ummer the ground-water shortage would have become far more serious. Vacation nd resort interests naturally benefitted by the salubrity of the month. The eat-wave of the 24-29th, however, extended down over south coastal areas to an nprecedented degree. At some stations new absolute maximum readings were tained, as at Nantucket, 95°; Edgartown, 98°;Framingham, 104°; Springfield, 3° and Providence, 102°. -------- M. T. N.

TEMPERATURE

e average monthly temperature for the Section, based on 155 records, was .9°, which is 1.8° above the mean for the past 61 years. The average tempera-re for the northern division was 67.4°; for the southern division, 70.9°. e highest monthly mean was 74.3 at Providence, R.I.; the lowest was 57.8° at ckerman Ravine, N.H. The highest that occurred was 105° at Nashua, N.H. on e 26th; the lowest was 34° at Somerset, Vt. on the 11th. The greatest month-range was 62° at Windham, N.H.; the least was 36° at Block Island, R.I.

PRECIPITATION

e average monthly precipitation for the Section, based on 379 records, was 42 inches, which is 1.31 inches below the mean for the past 61 years. The erage precipitation for the northern division was 2.64 inches; for the south-n division, 2.63 inches. The greatest monthly amount reported was 6.97 inches Plymouth, N.H., (1 mi. SW); the least was 0.06 inch at Glen Cove, Me. The eatest amount in 24 hours was 3.60 inches at Taunton, Mass. on the 12th. The erage number of days with .01 or more of precipitation was 7, which is 3 be-w the mean for the past 61 years.

The following reference notes apply only to Table 7 - Daily River Stages:

Readings are made at approximately 7 a.m. (local time). They are provisional and subject to correction. Final and corrected stages will be published in the annual publication "Daily River Stages - Principal Rivers of the United States".

a Obstructed by rough ice.	f Shore ice.
b Frozen but open at gage.	g Floating ice.
c Upper surface of smooth ice.	h Pool stage.
d Ice gorge above gage.	i Dry at gage.
e Ice gorge below gage.	j Interpolated.

REFERENCE NOTES

The four digit identification numbers in the index number column of the Station Index are assigned on a state basis. There will be no duplication of numbers within a state.

Stations appearing in the Index, but for which data are not listed in the tables, are either missing or received too late for inclusion in this issue.

Delayed data and corrections will be carried only in the June and December issues of this bulletin.

Data in Tables 3, 5 and 6 are for the 24-hours ending at time of observation. See the Station Index for observation time.

-	No record.
+	And also on later dates.
*	Amount included in following measurement, time distribution unknown.
//	Gage is equipped with windshield.
6	No recording gage, precipitation is measured at 6-hourly intervals.
a, b, c, through i	Number of days missing. a indicates one day missing, b indicates two days missing, etc.
ar	This entry in time of observation column in Station Index means after rain.
n	This entry in time of observation column in Station Index means noon.
ss	This entry in time of observation column in Station Index means sunset.
r	Station equipped with recording gage only. All amounts in Table 3 are from the non-recording gages, except for stations with this reference.
x	Daily precipitation totals in Table 3 are for the 24-hours ending at 1:30 A.M., E.S.T., of the following day.
z	Hourly amounts from recording gage at the same site may be found in Table 4.
T	Trace, an amount too small to measure.

Data in Table 4 were formerly published in the Hydrologic Bulletin for North Atlantic District. Amounts in this table are from recording gages. Traces are not shown.

Subscription Price: 15¢ per copy; $1.50 a year. (Yearly subscription includes Annual Summary. Correspondence regarding subscriptions should be addressed to the Weather Records Processing Center, Federal Building, Albany 1, N.Y.)

SEPTEMBER 1948

Volume LX No. 9

WASHINGTON: 1948

ACKNOWLEDGMENTS

In addition to the climatological data from some 6,000 Weather Bureau and cooperative weather stations, this bulletin series contains records from Hydroclimatic Network Stations which were formerly reproduced in the Hydrologic Bulletin Series. The Hydroclimatic Network is a nationwide net of rain gages -- mostly of the recording type which produce continuous records of precipitation. It was established in 1939 at the request of the Corps of Engineers, Department of the Army, to supplement existing precipitation stations in order to provide records of rainfall intensity which were essential to the planning of flood control and related works by the Corps of Engineers. This Network, now numbering about 2,000 recording, and 1,000 non-recording rain gages, has been maintained by the Weather Bureau through working funds transferred annually to the Weather Bureau by the Corps of Engineers. These transfers averaged about $250,000 per year between 1940 and 1944, and nearly $375,000 since that date. For the years 1940-42, the Department of Agriculture transferred about $100,000 per year to provide data required in its work, and since 1947 the Bureau of Reclamation has transferred about $25,000 per year to meet the increasing needs of their program in the Western States.

Previous to the introduction of this bulletin series, data from Hydroclimatic Network stations were presented in bulletins (Hydrologic Bulletins) which were issued monthly for each of 8 drainage areas embracing the entire United States, but since the Network was established to meet the internal requirements of the Federal agencies referred to above, no provision was made for public dissemination of the data, distribution being limited to cooperating agencies and to certain public repositories. A list of locations where reference copies of the Hydrologic Bulletin Series are available for inspection may be obtained upon application to Chief, U.S. Weather Bureau, Washington 25, D.C.

Many other records published in this bulletin have been made available through the cooperation of various public offices, private agencies, and individuals as listed in the Station Index.

NEW ENGLAND - SEPTEMBER 1948

W. H. Tracy, Section Director - Boston

GENERAL SUMMARY

he temperature continued at high summer levels in September, 1948, for the first wo weeks, culminating in maximum readings near or a little above 90° on the 13th xcept in northern Maine and coastal regions. Under the persistent heat and dry- ess vegetation deteriorated rapidly. A cool period followed, and frosts of the 6th and 17th practically terminated tender crops except in areas where natural r artificial protection retarded radiational cooling and maintained temperatures bove the general level. Forest-fire hazard caused closing of the woods, delay- ng the hunting season. Although numerous fires occurred, they were confined to mall areas by vigilant and effective measures that developed out of the calami- ous experience of last October. However, a bog forest fire in Knox County, Me., urned from the 2nd to the 24th, at one time requiring services of 500 men to ubdue. Moderate showers over most of the section on the 18-20th temporarily iminished the danger, but there was a quick return to drouth conditions in the ollowing warm, sunny days. It proved to be the sunniest September of official ecord, delightful as a prolongation of summer recreation, but disastrous to rops of late harvesting. Reports from rural areas, particularly in central and astern parts stressed shortage of water supplies, wells dry, pastures burned, tream flow much reduced, heavy withdrawals from reservoir storage to maintain atisfactory rates of flow in the larger rivers. All of these concomitants of routh became more acute as the month progressed, but during the night of the 0th general showers occurred in the Southern Division. This greatly eased the ire-weather tension, but did little to restore water supplies.

TEMPERATURE

he average monthly temperature for the Section, based on 150 records, was 60.8°, hich is 0.5° above the mean for the past 61 years. The average temperature for he northern division was 58.8°; for the southern division, 63.3°. The highest onthly mean was 66.6° at Springfield, Mass.; the lowest was 51.4° at Tuckerman avine, N.H. The highest recorded was 95° at Franklin, N.H. on the 13th; the owest was 24° at Dorset and Somerset, Vt., and West Cummington, Mass. on the 7th. The greatest monthly range was 69° at Corinna, Me.; the least was 32° at lock Island, R.I.

PRECIPITATION

he average monthly precipitation for the Section, based on 151 records, was .01 inches, which is 2.72 inches below the mean for the past 61 years. The verage precipitation for the northern division was 1.04 inches; for the sou- hern division 0.99 inch. The greatest monthly amount reported was 3.62 inches t Nantucket, Mass.; the least was 0.03 inch at Lawrence, Mass. The greatest mount in 24 hours was 2.48 inches at Nantucket, Mass., on the 20th. The verage number of days with .01 or more of precipitation was 5, which is 4 less han the mean for the past 61 years.

REFERENCE NOTES

The four digit identification numbers in the index number column of the Station Index are assigned on a state basis. There will be no duplication of numbers within a state.

Stations appearing in the Index, but for which data are not listed in the tables, are either missing or received too late for inclusion in this issue.

Delayed data and corrections will be carried only in the June and December issues of this bulletin.

Data in Tables 3, 5 and 6 are for the 24-hours ending at time of observation. See the Station Index for observation time.

Unless otherwise indicated, dimensional units used in this bulletin are: Temperature in °F., precipitation and evaporation in inches, river stages in feet, and wind movement in miles.

- No record.
+ And also on later dates.
* Amount included in following measurement, time distribution unknown.
// Gage is equipped with windshield.
6 No recording gage, precipitation is measured at 6-hourly intervals.
m One or more days of record missing; see Table 5 for detailed daily record.
n This entry in time of observation column in Station Index means noon
ar This entry in time of observation column in Station Index means after rain.
ss This entry in time of observation column in Station Index means sunset.
r Station equipped with recording gage only. All amounts in Table 3 are from the non-recording gages, except for stations with this reference.
s Storage precipitation station. Precipitation measurements, made at irregular intervals, will be published in the June issue of this publication.
x Daily precipitation totals in Table 3 are for the 24-hours ending at 1:30 A.M., E.S.T., of the following day.
z Hourly amounts from the recording gage at the same site may be found in Table 4.
T Trace, an amount too small to measure.

When hourly precipitation is accumulated over a period of 3 or more calendar days, with unknown hourly or daily distribution, the first and last days are shown in Table 4.

When hourly precipitation is missing for several days, only the first and last days are shown in Table 4.

Data in Table 4 were formerly published in the Hydrologic Bulletin for North Atlantic District. Amounts in this table are from recording gages. Traces are not shown.

Subscription Price: 15¢ per copy; $1.50 a year. (Yearly subscription includes
Annual Summary. Correspondence regarding subscriptions should be addressed to
the Weather Records Processing Center, Federal Building, Albany 1, N.Y.)

The following reference notes apply only to Table 7 - Daily River Stages:

Readings are made at approximately 7 a.m. (local time). They are provisional and subject to correction. Final and corrected stages will be published in the annual publication "Daily River Stages - Principal Rivers of the United States".

a Obstructed by rough ice.
b Frozen but open at gage.
c Upper surface of smooth ice.
d Ice gorge above gage.
e Ice gorge below gage.

f Shore ice.
g Floating ice.
h Pool stage.
i Dry at gage.
j Interpolated.

See reference notes following Station Index.

WASHINGTON: 1949

NEW ENGLAND - OCTOBER 1948

W. E. Tracy, Section Director - Boston, Mass.

GENERAL SUMMARY

During October, 1948 the averages of temperature and precipitation over the Section as a whole, were not far from normal Deficient rainfall amounts in western and central regions were balanced by above normal precipitation in the eastern par particularly near the southeast coast, where a heavy coastal storm, the only serious disturbance of the month, brought three to more than five inches of rain from the 23rd to the 26th. The latter figure was exceeded from Martha's Vineyard and Nantucket northward over Plymouth, Bristol and Barnstable Counties. Largely as a result of this storm monthly total in this area were from 7 to 9 inches. A deepening storm center which moved northeastward about one hundred miles offshore was blocked by high pressure, and during its slow progress heavy rains persisted for three days or more, while winds within the storm system increased to gale velocity, reaching a 50 to 60 miles per hour rate at a few points. Marin losses, however, were confined to small-craft damage and surf erosion on coastal highways and breakwaters. Except in Rhode Island and eastern Massachusetts this storm did not increase water storage supplies. In the northern division and western parts of the southern division ground-water levels and run-off continued well below normal. The temperature ranges were in general not far from seasonal levels and hardy vegetation, which in the areas where cold was modified by topography or water proximity, had withstood the frost of September 16-17, still survived until the cold morning of October 19. Even thereafter to the end of the month some sheltered plots near the coast continued to show life and produce blooms. --- M.T.N.

TEMPERATURE

The average monthly temperature for the Section, based on 147 records, was 48.7°, which is 0.9° below the mean for the past 61 years. The average temperature for the northern division was 46.5°; for the southern division, 57.3°. The highest monthly mean was 55.1° at New London, Conn.; the lowest was 41.9° at Lemington, Vt. The highest recorded was 84° at Winslow, Me., on the 1st; the lowest was 11° at Somerset, Vt., on the 22nd. The greatest monthly range was 67° at Millinocket Dam, Me., and Massabesic Lake, N.H.; the least was 34° at Block Island, R.I.

PRECIPITATION

The average monthly precipitation for the Section, based on 147 records, was 3.06 inches, which is 0.39 inch below the mean for the past 61 years. The average precipitation for the northern division was 2.86 inches; for the southern division, 3.29 inches. The greatest monthly amount reported was 9.31 inches at Edgartown, Mass.; the least was 0.74 inches at Danbury, Conn. The greatest amount in 24 hours was 3.05 inches at Nantucket, Mass., on the 24th. The average number of days with .01 or more of precipitation was 9, which is the mean for the past 61 years.

The average snowfall for the northern division, based on 79 records, was 0.4 inch; for the southern division, based on 68 records, a trace; for the Section, based on 147 records, 0.2 inch, which is the mean for the past 61 years.

ACKNOWLEDGMENTS

In addition to the climatological data from some 6,000 Weather Bureau and cooperative weather stations, this bulletin series contains records from Hydroclimatic Network Stations which were formerly reproduced in the Hydrologic Bulletin Series. The Hydroclimatic Network is a nationwide net of rain gages -- mostly of the recording type which produce continuous records of precipitation. It was established in 1939 at the request of the Corps of Engineers, Department of the Army, to supplement existing precipitation stations in order to provide records of rainfall intensity which were essential to the planning of flood control and related works by the Corps of Engineers. This Network, now numbering about 2,000 recording, and 1,000 non-recording rain gages, has been maintained by the Weather Bureau through working funds transferred annually to the Weather Bureau by the Corps of Engineers. These transfers averaged about $250,000 per year between 1940 and 1944, and nearly $375,000 since that date. For the years 1940-42, the Department of Agriculture transferred about $100,000 per year to provide data required in its work, and since 1947 the Bureau of Reclamation has transferred about $25,000 per year to meet the increasing needs of their program in the Western States.

Previous to the introduction of this bulletin series, data from Hydroclimatic Network stations were presented in bulletins (Hydrologic Bulletins) which were issued monthly for each of 8 drainage areas embracing the entire United States, but since the Network was established to meet the internal requirements of the Federal agencies referred to above, no provision was made for public dissemination of the data, distribution being limited to cooperating agencies and to certain public repositories. A list of locations where reference copies of the Hydrologic Bulletin Series are available for inspection may be obtained upon application to Chief, U.S. Weather Bureau, Washington 25, D.C.

Many other records published in this bulletin have been made available through the cooperation of various public offices, private agencies, and individuals as listed in the Station Index.

The following reference notes apply only to Table 7 - Daily River Stages:

Readings are made at approximately 7 a.m. (local time). They are provisional and subject to correction. Final and corrected stages will be published in the annual publication "Daily River Stages - Principal Rivers of the United States".

a	Obstructed by rough ice.	f	Shore ice.
b	Frozen but open at gage	g	Floating ice.
c	Upper surface of smooth ice.	h	Pool stage
d	Ice gorge above gage.	i	Dry at gage.
e	Ice gorge below gage.	j	Interpolated.

See reference notes following Station Index

REFERENCE NOTES

The four digit identification numbers in the index number column of the Station Index are assigned on a state basis. There will be no duplication of numbers within a state.

Stations appearing in the Index, but for which data are not listed in the tables, are either missing or received too late for inclusion in this issue.

Delayed data and corrections will be carried only in the June and December issues of this bulletin.

Data in Table 3, 5 and 6 are for the 24-hours ending at time of observation. See the Station Index for observation time.

Unless otherwise indicated, dimensional units used in this bulletin are: Temperature in °F., precipitation and evaporation in inches, river stages in feet, and wind movement in miles.

-	No record.
+	And also on later dates.
*	Amount included in following measurement, time distribution unknown.
//	Gage is equipped with windshield.
6	No recording gage, precipitation is measured at 6-hourly intervals.
m	One or more days of record missing; see Table 5 for detailed daily record.
n	This entry in time of observation column in Station Index means noon.
ar	This entry in time of observation column in Station Index means after rain.
ss	This entry in time of observation column in Station Index means sunset.
r	Station equipped with recording gage only. All amounts in Table 3 are from the non-recording gages, except for stations with this reference.
s	Storage precipitation station. Precipitation measurements, made at irregular intervals, will be published in the June issue of this publication.
x	Daily precipitation totals in Table 3 are for the 24-hours ending at 1:30 A.M., E.S.T., of the following day.
z	Hourly amounts from the recording gage at the same site may be found in Table 4.
T	Trace, an amount too small to measure.

When hourly precipitation is accumulated over a period of 3 or more calendar days, with unknown hourly or daily distribution, the first and last days are shown in Table 4.

When hourly precipitation is missing for several days, only the first and last days are shown in Table 4.

Data in Table 4 were formerly published in the Hydrologic Bulletin for North Atlantic District. Amounts in this table are from recording gages. Traces are not shown.

CLIMATOLOGICAL DATA

NEW ENGLAND

NOVEMBER 1948

Volume LX No. 11

ALBANY: 1949

NEW ENGLAND - NOVEMBER 1948

W. H. Tracy, Section Director - Boston

GENERAL SUMMARY

Several moderate to heavy rainstorms occurred during November, 1948, well spaced as to time intervals and well distributed geographically. Total monthly amounts ranged from around four inches at border stations of New England on the south, west and northeast, to over seven inches at many stations in the central highlands, largely falling in the genera rains of the 4th, 10-11th, and 19-20th. Providentially, these copious rains, falling on unfrozen ground, went far towar replenishing ground and storage water supplies, which had been falling lower and lower since midsummer and had reached seriously low levels, particularly in New Hampshire and western parts of the southern division. Groundwater levels rose appreciably and for the first time in many months stream flow became above normal. The first general snow of the season did not occur until the 29th, although some light falls had been reported previously in northern and elevated regions. From western Connecticut through central and northeastern Massachusetts and southern New Hampshire from one to three inches fell, which soon melted. The absence of snow cover to the north was most unusual, the northern division receivin less snowfall than in any November since 1890, when it was negligible.

It was the warmest November of official record, with the average temperature five to ten degrees above normal. The previous high record, 43.7° in 1931, was exceeded by 0.1°. In southeastern coastal districts the minimum temperature did not fall below freezing until the 29th, and for the first time in November the minimum in coldest parts of the Section did not fall below 10°, both circumstances unprecedented within the period of record. Maximum temperatures in middle an upper 70's on the 6th established a new record for so late in the season over such a large area. --- M.T.N.

TEMPERATURE

The average monthly temperature for the Section, based on 150 records, was 43.8°, which is 5.6° above the mean for the past 61 years. The average temperature for the northern division was 41.4°; for the southern division, 46.6°. The highest monthly mean was 50.7° at Block Island, R.I.; the lowest was 36.1° at Millinocket Dam, Me. The highest recorded was 79° at Billerica, Mass., on the 6th; the lowest was 10° at Fabyans, N.H., on the 30th. The greatest monthly range was 65° at Billerica, Mass., the least was 30° at Eastport, Me.

PRECIPITATION

The average monthly precipitation for the Section, based on 149 records, was 5.82 inches, which is 2.22 inches above the mean for the past 61 years. The average precipitation for the northern division was 6.02 inches; for the southern division 5.56 inches. The greatest monthly amount reported was 8.54 inches at Woodstock, N.H.; the least was 3.65 inches at Knightville Dam, Mass. The greatest amount in 24 hours was 3.27 inches at Dawson Lake, Conn., on the 11th. The average number of days with .01 inch or more of precipitation was 15, which is 5 above the mean for the past 61 years.

The average snowfall for the northern division, based on 83 records, was 1.0 inch; for the southern division, based on 66 records, 1.3 inches; for the Section, based on 149 records, 1.2 inches, which is 3.5 inches below the mean for the past 61 years.

ACKNOWLEDGMENTS

In addition to the climatological data from some 6,000 Weather Bureau and cooperative weather stations, this bulletin series contains records from Hydroclimatic Network Stations which were formerly reproduced in the Hydrologic Bulletin Series. The Hydroclimatic Network is a nationwide net of rain gages -- mostly of the recording type which produce continuous records of precipitation. It was established in 1939 at the request of the Corps of Engineers, Department of the Army, to supplement existing precipitation stations in order to provide records of rainfall intensity which were essential to the planning of flood control and related works by the Corps of Engineers. This Network, now numbering about 2,000 recording, and 1,000 non-recording rain gages, has been maintained by the Weather Bureau through working funds transferred annually to the Weather Bureau by the Corps of Engineers. These transfers averaged about $250,000 per year between 1940 and 1944, and nearly $375,000 since that date. For the years 1940-42, the Department of Agriculture transferred about $100,000 per year to provide data required in its work, and since 1947 the Bureau of Reclamation has transferred about $25,000 per year to meet the increasing needs of their program in the Western States.

Previous to the introduction of this bulletin series, data from Hydroclimatic Network stations were presented in bulletins (Hydrologic Bulletins) which were issued monthly for each of 8 drainage areas embracing the entire United States, but since the Network was established to meet the internal requirements of the Federal agencies referred to above, no provision was made for public dissemination of the data, distribution being limited to cooperating agencies and to certain public repositories. A list of locations where reference copies of the Hydrologic Bulletin Series are available for inspection may be obtained upon application to Chief, U.S. Weather Bureau, Washington 25, D.C.

Many other records published in this bulletin have been made available through the cooperation of various public offices, private agencies, and individuals as listed in the Station Index.

The following reference notes apply only to Table 7 - Daily River Stages:

Readings are made at approximately 7 a.m. (local time). They are provisional and subject to correction. Final and corrected stages will be published in the annual publication "Daily River Stages - Principal Rivers of the United States".

a	Obstructed by rough ice.	f	Shore ice
b	Frozen but open at gage.	g	Floating ice.
c	Upper surface of smooth ice.	h	Pool stage.
d	Ice gorge above gage.	i	Dry at gage.
e	Ice gorbe below gage.	j	Interpolated.

REFERENCE NOTES

The four digit identification numbers in the index number column of the Station Index are assigned on a state basis. There will be no duplication of numbers within a state.

Stations appearing in the Index, but for which data are not listed in the tables, are either missing or received too late for inclusion in this issue.

Delayed data and corrections will be carried only in the June and December issues of this bulletin.

Data in Table 3, 5 and 6 are for the 24-hours ending at time of observation. See the Station Index for observation time.

Unless otherwise indicated, dimensional units used in this bulletin are: Temperature in °F., precipitation and evaporation in inches, river stages in feet, and wind movement in miles.

-	No record.
+	And also on later dates.
*	Amount included in following measurement, time distribution unknown.
//	Gage is equipped with windshield.
6	No recording gage, precipitation is measured at 6-hourly intervals.
m	One or more days of record missing; see Table 5 for detailed daily record.
n	This entry in time of observation column in Station Index means noon.
ar	This entry in time of observation column in Station Index means after rain.
ss	This entry in time of observation column in Station Index means sunset.
r	Station equipped with recording gage only. All amounts in Table 3 are from the non-recording gages, except for stations with this reference.
s	Storage precipitation station. Precipitation measurements, made at irregular intervals, will be published in the June issue of this publication.
x	Daily precipitation totals in Table 3 are for the 24-hours ending at 1:30 A.M., E.S.T., of the following day.
z	Hourly amounts from the recording gage at the same site may be found in Table 4.
T	Trace, an amount too small to measure.

When hourly precipitation is accumulated over a period of 3 or more calendar days, with unknown hourly or daily distribution, the first and last days are shown in Table 4.

When hourly precipitation is missing for several days, only the first and last days are shown in Table 4.

Data in Table 4 were formerly published in the Hydrologic Bulletin for North Atlantic District. Amounts in this table are from recording gages. Traces are not shown.

Subscription Price: 15¢ per copy; $1.50 a year. (Yearly subscription includes Annual Summary. Correspondence regarding subscriptions should be addressed to the Weather Records Processing Center, Federal Building, Albany 1, N.Y.)

CLIMATOLOGICAL DATA

NEW ENGLAND

DECEMBER 1948
Volume LX No. 12

ALBANY: 1949

NEW ENGLAND - DECEMBER 1948

W. H. Tracy, Section Director - Boston

GENERAL SUMMARY

The belated "Indian Summer" weather which characterized the previous month was prolonged through the first seventeen days of December, 1948. These mild, snowless days favored out-of-door activities not ordinarily practicable in December. Only a few light rainstorms occurred in this period. The green grass and hardy blooms that continued in the coastal areas as late as the 18th were indicative of the completely unseasonable warmth that had persisted almost uninterruptedly for more than seven weeks. Beginning on the 18th there was a marked change to the rigors of winter. A snowstorm on the 19th deposited amounts ranging from one and one-half feet in southwestern Connecticut to an inch or less north of Massachusetts. In the Cape Cod area there was the greatest damage from freezing wet snow and rain in ten years. The damage, mostly to wire facilities as poles and tree branches and wires collapsed under weight of ice and gales, was estimated at $250,000. Electric power was suspended on the south coast and the islands. Little benefit accrued to winter sports agencies in northern highlands, which were still unable to function because of the dearth of snow. Such storms as occurred thus far produced substantial ground cover only in the southern division, an anomaly strikingly similar to early winter of 1947-8. Cold weather followed with sub-zero readings commonly in all interior regions on the 25th, 26th and 27th. For a few days near Christmas temperatures ranged from 10 to 15 degrees below normal.

During the last three days of the month a deepening and intensifying area of low pressure passed northward from the Middle Atlantic Coast up through western Connecticut, western Massachusetts, Vermont, central New Hampshire and Maine. A cold front bearing down from the north for awhile retarded its progress, and for more than sixty hours the mixing between the very warm, moist air and the cold air largely took place over a relatively small area in eastern New York and western New England. Only light to moderate amounts fell in eastern parts of southern New England. The cold front finally retreated, occlusion took place and the shallowing depression moved northeastward, its energy dissipated. In the two and one-half days, however, it had deposited from seven to nearly eleven inches over a 4500 mile area, caused record floods in the Housatonic and Naugatuck Rivers and major floods elsewhere in the region. Several persons were drowned, 400 families were evacuated, $11,000,000 damage was produced, rail and highway travel was suspended. Easterly gales and high tides on the 31st caused widespread damage on the southeast coast, including five Navy boats at Quonset Point, R.I. The month ended with the ground bare except in some mountain notches and in interior Maine.

TEMPERATURE

The average monthly temperature for the Section, based on 145 records, was 29.3°, which is 2.9° above the mean for the past 61 years. The average temperature for the northern division was 26.3°, for the southern division 32.8°. The highest monthly mean was 39.2° at Block Island, R.I., the lowest was 19.9° at Caribou, Me. The highest recorded was 60° at Providence, R.I., on the 7th, and at several Massachusetts stations on various dates; the lowest was -26° at Lemington, Vt., on the 25th. The greatest monthly range was 77° at Lemington and Enosburg Falls, Vt.; the least was 45° at Nantucket, Mass.

PRECIPITATION

The average monthly precipitation for the Section, based on 143 records, was 3.71 inches, which is 0.40 inch above the mean for the past 61 years. The average precipitation for the northern division was 3.46 inches; for the southern division 4.02 inches. The greatest monthly amount reported was 10.91 inches at Torrington, Conn.; the least was 0.96 inch at Middleton, Mass. The greatest amount in 24 hours was 6.72 inches at Peru, Mass., on the 31st. The average number of days with .01 inch or more of precipitation was 10, which is the mean for the past 61 years.

The average snowfall for the northern division, based on 71 records, was 5.6 inches; for the southern division, based on 56 records, 8.9 inches; for the Section, based on 127 records, 7.1 inches, which is 4.2 inches below the mean for the past 61 years.

ACKNOWLEDGMENTS

In addition to the climatological data from some 6,000 Weather Bureau and cooperative weather stations, this bulletin series contains records from Hydroclimatic Network Stations which were formerly reproduced in the Hydrologic Bulletin Series. The Hydroclimatic Network is a nationwide net of rain gages--mostly of the recording type which produce continuous records of precipitation. It was established in 1939 at the request of the Corps of Engineers, Department of the Army, to supplement existing precipitation stations in order to provide records of rainfall intensity which were essential to the planning of flood control and related works by the Corps of Engineers. This Network, now numbering about 2,000 recording, and 1,000 non-recording rain gages, has been maintained by the Weather Bureau through working funds transferred annually to the Weather Bureau by the Corps of Engineers. These transfers averaged about $250,000 per year between 1940 and 1944, and nearly $375,000 since that date. For the years 1940-42, the Department of Agriculture transferred about $100,000 per year to provide data required in its work, and since 1947 the Bureau of Reclamation has transferred about $25,000 per year to meet the increasing needs of their program in the Western States.

Previous to the introduction of this bulletin series, data from Hydroclimatic Network stations were presented in bulletins (Hydrologic Bulletins) which were issued monthly for each of 8 drainage areas embracing the entire United States, but since the Network was established to meet the internal requirements of the Federal agencies referred to above, no provision was made for public dissemination of the data, distribution being limited to cooperating agencies and to certain public repositories. A list of locations where reference copies of the Hydrologic Bulletin Series are available for inspection may be obtained upon application to Chief, U.S. Weather Bureau, Washington 25, D.C.

Many other records published in this bulletin have been made available through the cooperation of various public offices, private agencies, and individuals as listed in the Station Index.

Daily River Stages will not be published in Climatological Data in the future. They will be published annually in the publication "Daily River Stages - Principal Rivers of the United States".

The following reference notes apply only to Table 7 - Daily River Stages:

Readings are made at approximately 7 a.m. (local time). They are provisional and subject to correction. Final and corrected stages will be published in the annual publication "Daily River Stages - Principal Rivers of the United States".

a Obstructed by rough ice.
b Frozen but open at gage.
c Upper surface of smooth ice.
d Ice gorge above gage.
e Ice gorge below gage.
f Shore ice.
g Floating ice.
h Pool stage.
i Dry at gage.
j Interpolated.

Daily River Stages will not be published in Climatological Data in the future. They will be published annually in the publication "Daily River Stages - Principal Rivers of the United States".

REFERENCE NOTES

The four digit identification numbers in the index number column of the Station Index are assigned on a state basis. There will be no duplication of numbers within a state.

Stations appearing in the Index, but for which data are not listed in the tables, are either missing or received too late for inclusion in this issue.

Delayed data and corrections will be carried only in the June and December issues of this bulletin.

Data in Tables 3, 5 and 6 are for the 24-hours ending at time of observation. See the Station Index for observation time.

Unless otherwise indicated, dimensional units used in this bulletin are: Temperature in °F., precipitation and evaporation in inches, river stages in feet, and wind movement in miles.

-	No record.
+	And also on later dates.
*	Amount included in following measurement, time distribution unknown.
//	Gage is equipped with windshield.
6	No recording gage, precipitation is measured at 6-hourly intervals.
m	One or more days of record missing; see Table 5 for detailed daily record.
n	This entry in time of observation column in Station Index means noon.
ar	This entry in time of observation column in Station Index means after rain.
ss	This entry in time of observation column in Station Index means sunset.
e	Water equivalent of snowfall wholly or partially estimated, using a ratio of 1 inch water equivalent to every 10 inches of new snowfall.
r	Station equipped with recording gage only. All amounts in Table 3 are from the non-recording gages, except for stations with this reference.
s	Storage precipitation station. Precipitation measurements, made at irregular intervals, will be published in the June issue of this publication.
x	Daily precipitation totals in Table 3 are for the 24-hours ending at 1:30 A.M., E.S.T., of the following day.
z	Hourly amounts from the recording gage at the same site may be found in Table 4.
T	Trace, an amount too small to measure.

When hourly precipitation is accumulated over a period of 3 or more calendar days, with unknown hourly or daily distribution, the first and last days are shown in Table 4.

When hourly precipitation is missing for several days, only the first and last days are shown in Table 4.

Data in Table 4 were formerly published in the Hydrologic Bulletin for North Atlantic District. Amounts in this table are from recording gages. Traces are not shown.

Subscription Price: 15¢ per copy; $1.50 a year. (Yearly subscription includes Annual Summary. Correspondence regarding subscriptions should be addressed to the Weather Records Processing Center, Federal Building, Albany 1, N.Y.)

ANNUAL SUMMARY 1948
Volume LX No. 13

ALBANY: 1949

NEW ENGLAND - 1948

W. H. Tracy, Section Director - Boston, Mass.

GENERAL SUMMARY

The year 1948, although near normal as to average temperature and total precipitation, showed several features in both elements that were outstanding in deviation. Noteworthy were the extremely low sub-zero temperatures reported at several periods in the first three months as contrasted with the record-breaking heat late in August. Witness also the drouth conditions of September, when less than a tenth of an inch of rain fell at some stations in both the northern and southern divisions as against the tropical downpours of June in north-central New Hampshire and Vermont, in October in southeastern Massachusetts, and in southwestern parts of the Section at the end of December. Another example of Nature's tendency to balance extremes: May was the cloudiest and September the sunniest in Weather Bureau section records.

The year began under the domination of the severe weather which arrived with the Winter Solstice and continued with but a few brief interludes until mid-March. There were frequent alternations of heavy snowstorms and cold-waves of a general pattern established at the beginning of the season. The deep cover of snow deposited in the storms just before and after Christmas, 1947, was increased so that by January 25th a maximum depth of 30 to 40 inches was concentrated over a 50 to 70-mile belt extending from western Connecticut and east-central and northeastern Massachusetts through southeastern New Hampshire away from the coast. Rarely over an extended period does snowfall in the southern division exceed that of the northern division, but this abnormality prevailed throughout the first half of the winter, due largely to the frequency of coastal storms advancing northeastward into air masses sufficiently cold to produce snow entirely. In early February the accumulated depth in western Connecticut was nearly three feet in the highlands, and in southern New Hampshire nearly four feet. The first break in nearly two months in the form of general rains and a period of thawing came on February 13th. Little flood damage occurred despite the heavy snow cover as the early snow blanket had prevented deep frost penetration, and the ground readily absorbed the melt. Probably the lack of frost in the ground was without precedent in recent New England history. Later storms deposited nearer normal snow cover in the northern division. In the three-month winter season, however, the total snowfall in the southern division was 70.2 inches, as compared with 64.4 inches in the northern division. These three months were well below normal in temperature, averaging 19.6° for the Section, and making it the coldest winter for 13 years though not approaching the memorable arctic winter of 1917-18, when the mean was 16.2°, or 3.4° lower. Cold and wintry weather continued, with frequent snowstorms until mid-March, with some record low temperatures in the first week. On the 15th there was a sudden, decisive change in the temperature pattern from the rigors of winter to pleasant spring mildness, which prevailed during the rest of the month except for a brief cold snap on the 29th. Streams and water levels reached high stages about the 22nd and remained so through April, but despite the potential threat of a late heavy snow cover serious floods did not develop because of the receptive capacity of unfrozen grounds and only moderate rains, well spaced as to time intervals. April was the first month in the last six with a plus departure, although it was but a half-degree, and killing frosts commonly occurred to near the end of the month. In May the agricultural needs of rain and warmth were oversupplied as to the former, while there was a definite lack of warm, sunny intervals between rainstorms. There was more cloudiness than in any other May of Weather Bureau record. Germination and plant growth was retarded and other seasonal interests as well as agriculture felt the need of sunshine and warmth.

The frequent on-shore winds and general showers continued to dominate the first half of June, delaying crop growth and discouraging seasonal business. Wide variations in rainfall totals ranged from marked deficiencies in northern-interior parts to greatly excessive amounts in western parts of the southern division. Thunderstorms, though frequent, were not severe except a series of such storms that struck the vicinity of St. Johnsbury, Vt., and moved eastward across the Franconia Range in New Hampshire on the 24th. The destructive wind and rain squalls caused much local damage. Loosening the soil, two landslides were set off down the slope of Mt. Lafayette, burying 350 feet of main highway. Above-normal stream flow and water supply were maintained. In the final week of June fair and hot weather went far toward rejuvenation of latent crops and stimulated summer business interests. In general the favorable conditions continued through July, with the Section averages of temperature and precipitation close to normal, but the erratic characteristics of summer storms resulted in rainfall totals varying from about an inch in western Maine to over eight inches in central Massachusetts. Scattered damage to hay and tobacco crops occurred in various widely separated areas from hail and tropical down-pours. At the end of July vegetation was in prime condition. Grasslands retained verdancy to an extent unusual in mid-summer. In August, following a general shower period on the 12-14th there began a period of hot, dry, sunny weather, culminating in the most severe and protracted heat-wave of record so late in the season. On the 26th and 27th maxima 95 to 105° were reported at many stations even in the northern division. The cumulative effects of drouth was evident in all growing things, animal and vegetable. Poultry died by thousands, water supplies fell to seriously low levels. The heat-wave extended southward over south coastal areas to produce new maximum temperature records even to the islands. Real summer weather was prolonged through the first two weeks of September, and the drouth areas received scant relief. It was the sunniest September of record, pleasant in the extension of summer recreational opportunities but disastrous to late crops. A cool period on the 16-17th brought general frosts except in naturally protected areas, practically terminating tender crops. Forest fire hazard caused closing of the woods. On the 30th general showers lessened the tension but did not augment the short water supplies. October was uneventful except for a severe coastal storm which moved northeastward about 100 miles off the coast on the 23-26th. Blocked by high pressure to the northeastward, in its slow progress it deposited 3 to 9 inches of rain over Nantucket, Martha's Vineyard and adjacent mainland. There was considerable small craft damage and surf erosion on coastal highways and breakwaters. General killing frost on the 19th killed such vegetation as had survived the frosts of September 16-17, except in sheltered near-coastal areas where life continued through November, which was the warmest of that name in Weather Bureau records. The ground remained unfrozen through November and several moderate to heavy rainstorms replenished water storage supplies which had fallen to seriously low levels in some districts. There was no general snowfall until the 29th and that was but one to three inches in the southern division. It shortly disappeared, and mild, snowless weather continued for the first eighteen days of December. Green grass and hardy blooms in sheltered plots were indicative of the extraordinary warmth that had prevailed almost uninterruptedly for more than seven weeks. An abrupt change to typical winter conditions began on December 19th with a snowstorm that deposited amounts ranging from a foot and a half in southwestern Connecticut to an inch or less north of Massachusetts. Great snow and ice damage occurred in the Cape Cod area, where wire facilities suffered suspension of service and a quarter million dollar property loss. Winter sports centers, equipped this year to handle a great volume of business, did not benefit and were still unable to function. The rather cold weather at this time and the still colder weather which prevailed for a few days around Christmas reduced the monthly excess in temperature to less than 3°. Near the end of the month a deepening and intensifying low-pressure area passed northward from the Middle Atlantic Coast up through western Connecticut and Massachusetts, then northeastward over central New Hampshire and Maine. A cold front bearing down from the north for awhile barred its progress and for more than sixty hours the mixing between the very warm, moist air and the cold air took place over a relatively small area in eastern New York and southwestern New England. The cold front finally retreated, occlusion took place and the shallowing depression moved northeastward, its energy dissipated. In the two and one-half days, however, it deposited from seven to nearly eleven inches of rain over a 4500 mile sector, caused record floods in the Housatonic and Naugatuck Rivers and major floods elsewhere. Roads were undermined and blocked by landslides, bridges washed out, industrial plants flooded, several hundred families evacuated, rail traffic suspended west of Greenfield. Several lives were lost and property damage was estimated at $11,000,000. On the southeast coast, easterly gales and high tides caused marine damage, including five Navy boats at Quonset, R.I. The month ended with the ground bare except in some mountain notches and in interior Maine.---M.T.N.

- - - - -

The average annual mean temperature for the Section was 45.6°, which is 0.3° below the mean for the past 61 years. The average temperature for the northern division was 43.1°; for the southern division 48.5°. The highest annual mean temperature was 51.8° at Providence WB City, R.I.; the lowest was 38.0° at Caribou WB Airport, Me. The highest temperature reported was 105° at Nashua, N.H., on August 26th; the lowest was -41° at First Connecticut Lake, N.H., on February 10th. The annual range for New England was 146°; the greatest local annual range was 133° at Chelsea and Wilder, Vt.; the least local annual range was 88° at Block Island, R.I.

The average annual precipitation for the Section was 42.21 inches, which is 0.18 inch above the mean for the past 61 years. The average precipitation for the northern division was 38.51 inches; for the southern division 45.89 inches. The average annual snowfall for the northern division was 71.1 inches; for the southern division 69.4 inches; and for the Section 70.1 inches which is 6.2 inches above the mean for the past 61 years. The greatest annual precipitation was 59.19 inches at Mount Washington WB, N.H.; the least annual amount was 26.46 inches at South Danbury, Conn. The greatest local monthly amount was 10.91 inches at Torrington, Conn., in December; the least local monthly amount was 0.03 inch at Lawrence, Mass., in September. The greatest amount in any twenty-four hour observational day was 6.72 inches at Peru, Mass., on December 31st. The average number of days with .01 inch or more of precipitation was 129, which is 6 above the mean for the past 61 years.

ACKNOWLEDGMENTS

In addition to the climatological data from some 6,000 Weather Bureau and cooperative weather stations, this bulletin series contains records from Hydroclimatic Network Stations which were formerly reproduced in the Hydrologic Bulletin Series. The Hydroclimatic Network is a nationwide net of rain gages--mostly of the recording type which produce continuous records of precipitation. It was established in 1939 at the request of the Corps of Engineers, Department of the Army, to supplement existing precipitation stations in order to provide records of rainfall intensity which were essential to the planning of flood control and related works by the Corps of Engineers. This Network, now numbering about 2,000 recording, and 1,000 non-recording rain gages, has been maintained by the Weather Bureau through working funds transferred annually to the Weather Bureau by the Corps of Engineers. These transfers averaged about $250,000 per year between 1940 and 1944, and nearly $375,000 since that date. For the years 1940-42, the Department of Agriculture transferred about $100,000 per year to provide data required in its work, and since 1947 the Bureau of Reclamation has transferred about $25,000 per year to meet the increasing needs of their program in the Western States.

Previous to the introduction of this bulletin series, data from Hydroclimatic Network stations were presented in bulletins (Hydrologic Bulletins) which were issued monthly for each of 8 drainage areas embracing the entire United States, but since the Network was established to meet the internal requirements of the Federal agencies referred to above, no provision was made for public dissemination of the data, distribution being limited to cooperating agencies and to certain public repositories. A list of locations where reference copies of the Hydrologic Bulletin Series are available for inspection may be obtained upon application to Chief, U.S. Weather Bureau, Washington 25, D.C.

Many other records published in this bulletin have been made available through the cooperation of various public offices, private agencies, and individuals as listed in the Station Index.

REFERENCE NOTES

Unless otherwise indicated, dimensional units used in this bulletin are: Temperature in °F; precipitation and evaporation in inches, and wind movement in miles. Evaporation is measured in the standard Weather Bureau type pan of 4 foot diamater unless otherwise shown by footnote following Table 4.

The four digit identification numbers in the Index are assigned on a state basis. There will be no duplication of numbers within a state.

Delayed data and corrections will be carried only in the June and December issues of Climatological Data.

- No record.
+ Also later dates or months.
B Adjusted to full month.
M 1 to 10 days' record missing; see monthly Climatological Data for detailed daily record.

The subscription price for this bulletin is 15 cents per copy or $1.50 a year (Yearly subscription includes the annual summary). Correspondence regarding subscriptions should be addressed to Weather Records Processing Center, Federal Building, Albany 1, N.Y.
